

Mark Lyons

mklyons.com | [github](https://github.com) | [linkedin](https://www.linkedin.com/in/marklyons) | Software Engineer - New York, NY

Full-stack software engineer with a big-tech foundation and hands-on startup experience, with a proven history of high-impact shipping, modernizing legacy systems, and guiding teams through ambiguity. Brings a blend of creativity, ownership, and execution. Now looking to apply this in a dynamic, impactful organization.

Experience

Dirac | August 2025 – March 2026

- Built the first *consumables* system, a new data model enabling ERP-grade material tracking (e.g., 5ml anti-seize, adhesives, etc.) and unlocking a new class of bill-of-materials driven manufacturing workflows for customers.
- Built a novel feature to identify hardware components within CAD files by analyzing geometry shape and symmetry.
- Standardized company on-call procedure, stabilizing production by resolving high-priority customer issues and defining the company's on-call playbook and triage process from scratch.

Meta | May 2022 – May 2025

- Served 1B daily traffic across a worldwide audience with IG Profile team.
- Delivered +\$130M/year in newly measurable ad revenue by fixing a back-navigation data-return failure in Instagram's Android feed object – originally identified while reducing server costs (saved an additional \$120k/year). Later found to improve profile-engagement depth across >1B users.
- Led the conversion and modularization of Instagram Profile's legacy 12k-LOC Java view layer into Kotlin, eliminating the largest technical bottleneck in the client-side codebase. Reduced profile load time by 4% globally and drove systematic modularization across 30+ partner teams.
- Co-led experiment of IG Highlights redesign into a grid-based surface, touching nearly every IG user worldwide. Though reverted based on experiment results, the project generated critical insights on user profile preferences, influencing multiple subsequent personalization and layout efforts.
- Initiated and shipped a cross-platform IG Subscriptions growth feature that increased subscription conversion 10% by simplifying the landing page creation flow. Built the Android implementation, validated metrics, and collaborated hands-on with iOS to achieve feature parity.

T. Rowe Price | September 2019 – April 2022

- Re-architected post-trade analysis software, leading to a 60% reduction in latency of reconciliation of in-house trade data with external vendor data and reducing average daily error/warning count by 20%.
- Led front-end and back-end redevelopment of a legacy web application in C#/.NET and Angular that supported traders and enabled them to accurately report trade information.
- Developed an administration site that allowed Enterprise Software Support teams to rectify certain issues in real time without having to page out to our development team.

Lascar Electronics | September 2018 – September 2019

- Developed a Javascript-based front-end for the dashboard of the EL-SIE, a new line of data loggers.
- Led development of second-generation flagship iOS app for Lascar's data loggers, resolving 70 critical issues including a transition to Swift 4.

Education

University of Maryland, College Park – B.S. Computer Science | May 2018
